

Examining attitudes and knowledge towards medical cannabis amongst individuals with chronic conditions: a UK study

This study will examine knowledge and attitudes amongst individuals with chronic conditions regarding cannabis for medical use. Research on the benefits of cannabis are conflicting, however, there are several studies that present cannabis as an effective coping strategy for several conditions, including fibromyalgia, inflammation, arthritis, cancer, pain relief, epilepsy, to name a few. My aim is to explore the medical aspect of cannabis in the eyes of those who have chronic conditions, and whether prohibition affects those who could potentially use cannabis for medicinal purposes.

Want to take part?

How to get involved is by following this link:
https://blss.eu.qualtrics.com/jfe/form/SV_9Td0WoFzaZjKDkN

You can take part using your phone or tablet, or you can type the link into the URL on a computer to find the study.

Your contribution to the study is greatly appreciated.
